Non-equilibrium thermodynamics - Wikipedia

Non-equilibrium thermodynamics is a branch of thermodynamics that deals with physical systems that are not in thermodynamic equilibrium but can be described in terms of variables (non-equilibrium state variables) that represent an extrapolation of the variables used to specify the system in thermodynamic equilibrium.

**Internal Variables in Non-Equilibrium
Thermodynamics ...**

The concept of internal variables is axiomatically introduced into nonequilibrium thermodynamics for avoiding small state spaces showing after effects. The connection between internal variables, projectors onto equilibrium subspace, and accompanying processes is demonstrated for discrete systems. Relaxation variables, chemical reactions, and Kestin-Ponter's model of plasticity are discussed.
