Inhibitors targeting a specific step of protein synthesis have enabled dissection of the translation pathway by allowing the characterization of events leading to the assembly of active polysomes, trapping intermediates of the initiation and elongation cycle, and providing insight into the molecular functions of protein factors (Pestka 1977; Vazquez 1979).

of growth, stimulators of misreading, and inhibitors of
protein synthesis in procaryotes and eucaryotes (18).
Vazquez and co-workers have studied the in vitro activities
of many aminoglycoside antibiotics in eucaryotic model
systems derived from yeasts and mammalian cells (20 and
