Below, a variety of methods are used to calculate the random walk. To accomplish this, each function pulls 1000 values of either 1 or -1 as defined in `inc` below. The timing test uses `microbenchmark` with 1000 replications for each method.

Simulate the random walk model with a drift | R

A random walk (RW) need not wander about zero, it can have an upward or downward trajectory, i.e., a drift or time trend. This is done by including an intercept in the RW model, which corresponds to the slope of the RW time trend.
